

All About Doreme Organic Pigments

Written By Nancy Jun Liang (Microblading Artist at Grand Arc Studio, Vancouver BC)

Doreme Pigment is a product of JHN Micro Tec. The founder Mike started his interest in pigmentation when he worked for a pigment manufacturing company, making paint. When Mike teamed up with his sister, a permanent makeup artist in Korea, they formulated Doreme.

Doreme is formulated to be a high pigmented permanent makeup brand that delivers quality and innovation. The manufacturing company, JHN Micro Tec, originated in Switzerland and moved to South Korea. South Korea has one of the most strict manufacturing guidelines for Cosmetic Pigments. These restrictions includes restriction on heavy metal content, emulsion stability, and Pigment particle sizes. JHN not only complies with South Korea's regulations but takes a step further in years of emulsion research to ensure the right viscosity for each of their lines. Emulsion, particle size and PH ratings are important when it comes to producing a pigment that will stay true to color, preventing unwanted fading results.

JHN Micro Tec produces three different lines of pigments in the Doreme Brand. They did this because the viscosity (thickness and consistency) has to be tailored to the different permanent makeup procedures available to ensure that the color heals true and do not migrate.

Organic Pigment Line

Doreme Organic Pigments are HPP Pigments. Organic Pigments have two classifications: CLP and HPP. Organic pigments tend to heal more vibrant than inorganic pigments. The color really "pops".

CLP (Classic Organic Pigment): Classic Organic Pigments comes straight from natural ingredients like plants and food. Because it comes form nature, a patch test is needed to ensure there will not be any allergic reactions.

HPP (High Performance Organic Pigment): High Performance Pigments exhibits enhanced durability with heat stability and chemical resistance. These pigments do not require a patch test due to its stability.

Organic Pigment Common Questions:

1) Why choose Inorganic Pigments if Organic Pigments heal more vibrantly?

Organic pigments may heal more vibrantly, but until recent years, organic pigments were all CLP pigments and required a patch test. With recent technology on HPP pigments, this is no longer the case.

Another reason for choosing inorganic over organic is pricing. Inorganic pigments tend to be cheaper than organic pigments.

2) Will Doreme Organic Pigment require a patch test?

No. Doreme Organic Pigments are HPP pigments. Due to HPP exhibiting enhanced durability and stability, no patch test is needed.

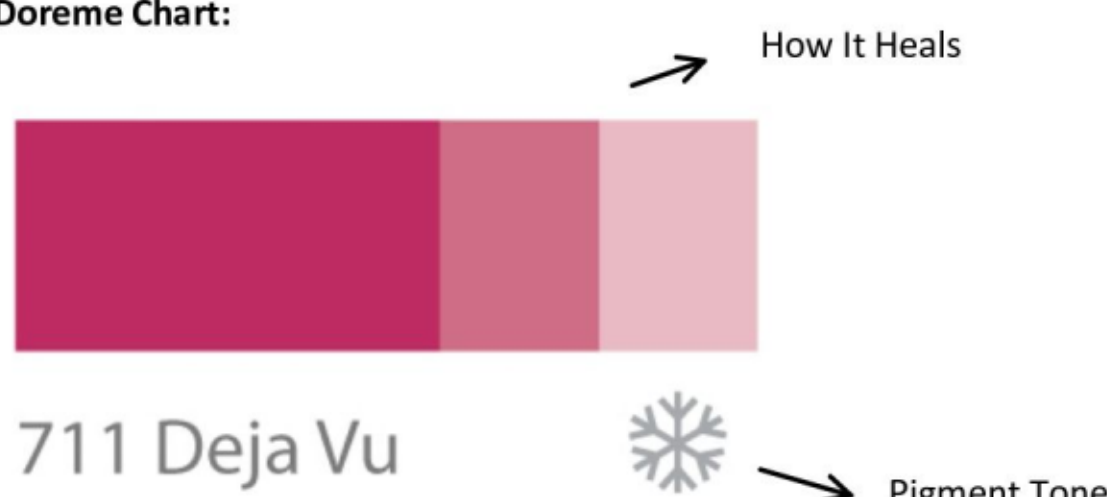

3) Will the pigment turned grey, red or blue?

With all Doreme Colors, in their pigment chart, it will specified the color's undertone. See How to Read Chart below for full information.

Same as inorganic pigments, if the client has a cool undertone, choose a pigment that will counter it, such as a warm toned pigment. This will ensure that the color heals true, not blue or grey.

Doreme Organic Colors will not heal red.

How To Read Doreme Chart:

Doreme Chart

Doreme Chart has the color, the color number, a gradient of how it may heal, and the pigment undertone.

Pigment Tone:

Our skin undertone can be either Warm, Cool or Neutral. Doreme Organic categorizes their color with the two tones:

Sun = Warm = More Red Pigment is used
Snowflake = Cool = More black Pigment is used

This will help us know which color is best suited for our clients.

Example: If client has a warm undertone, a cool pigment should be used to heal true to color.

If client has a neutral undertone, warm or cool can be used.
If client has cool undertone, a warm pigment should be used.

How it Heals

Each client not only has different undertone, but also have different skin tone and genetics that affects the healed color.

So how do you know which gradient they will heal?

Generally, the darker the original lip color, the darker they will heal - Generally. This is the same for all brands of pigments in the world. The only difference is that Doreme has a gradient chart.

Boosters:

Doreme has 3 boosters for each type of Permanent Makeup Procedure and they also have a Sealer that works with all procedures.

Function of the Boosters:

- Weakens the skin allowing easier needle penetration
- Reduces the transport of lymph, increasing pigment retention.
- Allow puncture holes to shut at a faster rate, fixing the pigment in place

How to use:

Boosters:

- Add 1 drop of Booster Brow to the pigment used for the procedure and stir well
- After the first pass (when skin is open) add neat Booster Brow with a micro-brush
- Allow to absorb and continue your procedure

Advice: Personally, I always use the boosters even during practice. I love the Doreme Concentrate line, but it does dry out fast during practice sessions, so I will always add boosters. My formula is 1 drop of booster on 2 pumps of Concentrate pigment.

Function of the Sealer:

Doreme Permanent Sealer is made for all procedures. The Sealer is used for after the procedure has been completed, accelerating the healing process. It also simplifies the aftercare procedure for the customer, reducing the possibility of any mishaps in following the aftercare system. Doreme Permanent Makeup Sealer helps keep your work crisp, and helps the customer with faster healing.

How to use:

- o After cosmetic procedure, apply a thorough coat of Permanent Sealer with micro-brush.

What is Dry Healing:

"Do Nothing" except keeping the treatment area as dry as possible for 10 days. Within 2-3 hours after the procedure wash your brows gently with your fingertips using a mild soap (such as Cetaphil), to remove any excess bodily fluid such as blood or lymph. And that's it for the next 10 days. Avoid any exercise that may put moisture in the area. If the area does get wet, pat dry immediately.
